

111-1基礎程式設計(2)

亞大資工系

Python Versions

PYTHON 2.X 🟓 PYTHON 3.X

FUTURE \longrightarrow

It is still entrenched in the software at certain companies It will take over Python 2 by the end of 2019

LIBRARY

Many older libraries built for Python 2 are not forwards compatible

Many of today's developers are creating libraries strictly for use with Python 3 0000

0100 0001

0000 0100 0001

Strings are stored as ASCII by default

7/2=3

Text Strings are Unicode by default

7/2=3.5

It rounds your calculation down to the nearest whole number

This expression will result in the expected result

print "WELCOME TO **GEEKSFORGEEKS**"

print("WELCOME TO **GEEKSFORGEEKS**"

It rounds your calculation down to the nearest whole number

This expression will result in the expected result

Python new features:

Python 3.10: Structural Pattern Matching

Python 3.6: f-Strings

Python 3.3: Virtual Environments

Python 3.2: Argparse

Python powerful features:

Iterators

Generators

Decorators

Context Managers

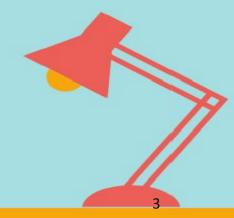

課程進度

- W1-Python簡介及程式工具
- W2-變數和運算
- W3-迴圈和格式化輸出
- W4-判斷式和容器
- W5-字串處理和輸出入
- W6-M1測驗

- W07-字典容器
- W08-檔案處理
- W09-函數
- W10-進階流程控制
- W11-進階運算
- W12-M2測驗

- W13-生成器和序列化
- W14-類別
- W15-裝飾器
- W16-模組和套件
- W17-進階程式設計
- W18-M3測驗

Python cheat sheet

Beginner's Python Cheat Sheet

Variables and Strings

Variables are used to store values. A string is a series of characters, surrounded by single or double quotes.

Hello world

print("Hello world!")

Hello world with a variable

msg = "Hello world!"
print(msg)

Concatenation (combining strings)

```
first_name = 'albert'
last_name = 'einstein'
full_name = first_name + ' ' + last_name
print(full name)
```

Lists

A list stores a series of items in a particular order. You access items using an index, or within a loop.

Make a list

```
bikes = ['trek', 'redline', 'giant']
```

Get the first item in a list

first_bike = bikes[0]

Get the last item in a list

last bike = bikes[-1]

Looping through a list

for bike in bikes: print(bike)

Adding items to a list

bikes = []
bikes.append('trek')
bikes.append('redline')
bikes.append('giant')

Making numerical lists

squares = []
for x in range(1, 11):
 squares.append(x**2)

Lists (cont.)

List comprehensions

squares = [x**2 for x in range(1, 11)]
Slicing a list

finishers = ['sam', 'bob', 'ada', 'bea']
first_two = finishers[:2]

Copying a list

copy_of_bikes = bikes[:]

Tuples

Tuples are similar to lists, but the items in a tuple can't be modified.

Making a tuple

dimensions = (1920, 1080)

If statements

If statements are used to test for particular conditions and respond appropriately.

Conditional tests

Conditional test with lists

'trek' in bikes 'surly' not in bikes

Assigning boolean values

game_active = True
can_edit = False

A simple if test

if age >= 18:
 print("You can vote!")

If-elif-else statements

if age < 4:
 ticket_price = 0
elif age < 18:
 ticket_price = 10
else:
 ticket_price = 15</pre>

Dictionaries

Dictionaries store connections between pieces of information. Each item in a dictionary is a key-value pair.

A simple dictionary

```
alien = {'color': 'green', 'points': 5}
Accessing a value
```

print("The alien's color is " + alien['color'])

Adding a new key-value pair

alien['x_position'] = 0

Looping through all key-value pairs

```
fav_numbers = {'eric': 17, 'ever': 4}
for name, number in fav_numbers.items():
    print(name + ' loves ' + str(number))
```

Looping through all keys

fav_numbers = {'eric': 17, 'ever': 4}
for name in fav_numbers.keys():
 print(name + ' loves a number')

Looping through all the values

fav_numbers = {'eric': 17, 'ever': 4}
for number in fav_numbers.values():
 print(str(number) + ' is a favorite')

User input

Your programs can prompt the user for input. All input is stored as a string.

Prompting for a value

name = input("What's your name? ")
print("Hello, " + name + "!")

Prompting for numerical input

age = input("How old are you? ")
age = int(age)

pi = input("What's the value of pi? ")
pi = float(pi)

Python Crash Course

Covers Python 3 and Python 2

nostarchpress.com/pythoncrashcourse

課程大綱

- Essential-基本的
 - IPO model: input-process-output (輸入-處理-輸出)
 - Input: input()函數, 變數型別轉換(int, float)
 - Process: 算術運算子和表示式(expressions)
 - Process: 運算子運算優先順序
 - Output: print()函數的參數(sep, end, file, flush)
 - 標準庫math的應用
 - 程式註解
- Advanced-進階的
 - 多行的字串
 - MarkDown語法

啟思博Kissipo 學習法

Kissipo = KISS principle + IPO model

KISS principle

"keep it simple, stupid" or "keep it stupid simple", is a design principle noted by the U.S. Navy in 1960.

https://en.wikipedia.org/wiki/KISS_principle

IPO model

The input–process–output (IPO) model is a widely used approach in systems analysis and software engineering for describing the structure of an information processing program or other process.

https://en.wikipedia.org/wiki/IPO_model

Kissipo Learning for Programming with Python(PWP)

Courseware: Notebook+ Github

- (1) 使用Notebook(Google Colab)教學。
- (2) 使用Github建立教案

Keep:

Variables and assignment operator and expression left-hand side and right-hand side unpacking

S&S:

help(), type(), len(), size()

IPO-I: input

input()
int(), float(), str()
split(), map()

IPO-P: Process

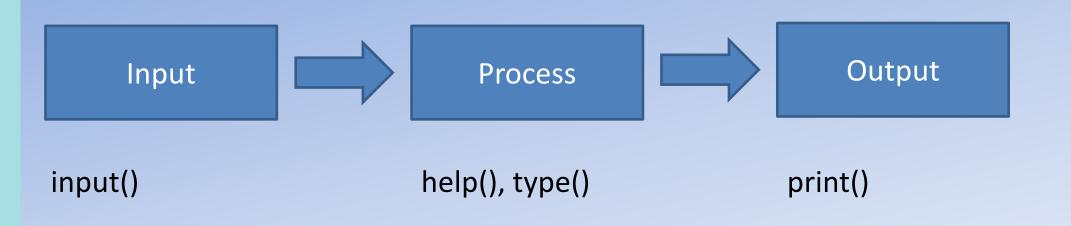

變數宣告,資料容器 for-loop/while-loop if, elif, else range()

IPO-O: output

print()
open(), write()

IPO Model(1)

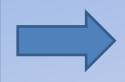

本章基本觀念是同學要知道: 輸入用input(),輸出用print() help()可以查看函數或類別的說明 type()可以查看變數的型別

IPO Model (2)

Process

Output

input()輸入一個變數 使用int()轉換成整數變數 使用float()轉換成浮點數變數 算術運算子 運算子優先序 程式中的字串表示 註解 print()函數的參數sep 和end Escape Sequence (逸出序列)

本章基本觀念是同學要知道:

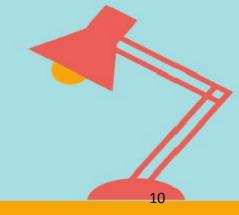

如何用input()輸入不同型別的數數

輸出print()有兩個參數sep 和end來控制輸出

Python 的算數運算包括:加減乘除(+ - * /), 次方(**), 商(//)和取餘數(%)。加減乘除(+ - * /), 次方(**)的計算結果是浮點數。商(//) 和取餘數(%)的計算結果是整數。

Topic 1(主題1)-輸入一個整數或浮點數

- Step 1: 輸入一個整數
- Step 2: 輸入一個浮點數

Topic 2(主題2)-算術運算子和表示式 (expressions)

• Step 1: 加減乘除

• Step 2: 商和餘數

• Step 3: 次方

Topic 3: 運算子優先序 (Operator precedence)

- Step 1: 先乘除後加減, 括號優先
- Step 2: 次方比加減乘除優先

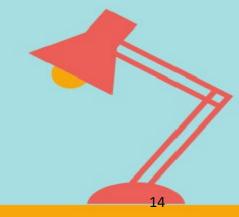

Topic 4(主題3)-標準庫math的應用

- Step 1: 計算pi 和sin(π/3)函數
- Step 2: 使用math標準庫的pi 和sin 函數
- Step 3: 使用as
- Step 4: 使用標準庫math的角度(degree)和弧度 (radian)轉換

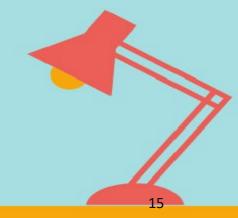

Topic 5: print()函數的參數

- Step 1: Hello World with 其他參數
- Step 2:Escape Sequence (逸出序列)

Topic 6: 多行的字串

- Step 1: 使用 字串尾部的\來建立長字串
- Step 2: 使用六個雙引號來建立長字串 " ... " 或 "" ... ""

Toic 7: 原始碼的字元編碼 (encoding)

- 預設 Python 原始碼檔案的字元編碼使用 UTF-8。在這個編碼中,世界上多數語言的文字可以同時被使用在字串內容、識別名 (identifier) 及註解中 --- 雖然在標準函式庫中只使用 ASCII 字元作為識別名,這也是個任何 portable 程式碼需遵守的慣例。如果要正確地顯示所有字元,您的編輯器需要能夠認識檔案為 UTF-8,並且需要能顯示檔案中所有字元的字型。
- 如果不使用預設編碼,則要聲明檔案的編碼,檔案的第一行要寫成特殊註解。語法如下:
- # -*- coding: encoding -*-
- 其中,encoding 可以是 Python 支援的任意一種 codecs。
- 比如,聲明使用 Windows-1252 編碼,源碼檔案要寫成:
- # -*- coding: cp1252 -*-
- 第一行的規則也有一種例外情況,在源碼以 UNIX "shebang" line 行開頭時。此時,編碼聲明要寫在檔案的第二行。例如:
- #!/usr/bin/env python3
- # -*- coding: cp1252 -*-

Topic 8: MarkDown語法

- Step 1: 標題
- Step 2: 分隔線
- Step 3: 粗體及斜體
- Step 4: 清單

Thanks! Q&A
